
Unit – 1 : Session – 6 : SLO – 1 | Process Life Cycle — Fill in the Missing Words

I. Completed Sentences (Process Life Cycle)

1. A PROCESS is a program in execution.
2. A process passes through states: NEW, READY, RUNNING, WAITING (BLOCKED) and TERMINATED.
3. The OS creates a process and assigns it a PROCESS CONTROL BLOCK (PCB) holding its state,
4. program counter, registers and memory information.
5. The SCHEDULER (dispatcher) picks a ready process and gives it the CPU.
6. When a running process requests I/O it moves to the WAITING state.
7. After I/O completes, the process returns to the READY queue.
8. When a process finishes execution it is TERMINATED and its resources are deallocated.
9. CONTEXT SWITCHING saves the state of one process and restores the state of another.

II. Role of the OS

1. Creation: fork()/spawn, PCB allocation, memory setup.
2. Scheduling: choosing which ready process runs next (short-term scheduler).
3. Termination: exit(), releasing memory, closing open files, removing the PCB.
