
Unit – 2 : Session – 6 : SLO – 1 | Multicore Processors and Parallel Execution — Word Search Clues

Clues

1. Multicore processors have multiple cores that can execute instructions simultaneously.
2. Running multiple tasks at the same time on different cores is called parallelism.
3. Concurrency is when tasks appear to run simultaneously by switching rapidly on a single core.
4. When multiple threads access and modify shared data without control, it can cause data inconsistency.
5. To avoid conflicts when accessing shared data, we use synchronization techniques like locks and mutex.
6. Load balancing is the process of distributing workload evenly across cores to improve performance.
7. Cache coherence ensures that all cores have the latest value of shared variables in their caches.
8. A race condition happens when two or more threads access shared data at the same time, causing unpredictable results.

Words hidden in the puzzle

1. balancing, cache, coherence, concurrency, condition, cores, data, load, mutex, parallelism, race, shared, synchronization
