

Unit – 5 : Session – 8 : SLO – 1 | Event-Driven GUI with Tkinter

I. Questions & Answers

1. Create a GUI window — `import tkinter as tk; root = tk.Tk(); root.title("My App"); root.geometry("300x150"); root.mainloop()`.
2. Widget that displays a message — `tk.Label` (e.g. `tk.Label(root, text="Hello").pack()`); for pop-ups, `tkinter.messagebox.showinfo()`.
3. Widget that triggers a function on click — `tk.Button` with the `command` option: `tk.Button(root, text="Go", command=my_func)`.

II. Minimal Example

1. `import tkinter as tk`
2. `root = tk.Tk()`
3. `tk.Label(root, text="Hello, Tkinter!").pack()`
4. `tk.Button(root, text="Click", command=lambda: print("clicked")).pack()`
5. `root.mainloop()`
