
Unit – 3 : Session – 10 : SLO – 2 | Multiple-Processor Scheduling — Identify the Concept

Concepts

1. A method where a process is allowed to run only on specific CPUs — Processor Affinity (hard affinity).
2. Processors push tasks from heavily loaded CPUs to less busy ones — Push Migration (load balancing).
3. Switches threads at instruction cycle boundaries — Fine-Grained Multithreading.
4. Architecture where each processor has its own memory access strategy — NUMA (Non-Uniform Memory Access): each CPU has faster access to its own local memory than to the rest of main memory.
