

Unit – 4 : Session – 11 : SLO – 1 | UDP Socket Behaviour

I. Fill in the Blanks

1. UDP does not guarantee reliable or ordered delivery (packets may be lost, duplicated or arrive out of order).
2. `sendto()` is used to send data along with a destination address (host, port) — UDP has no connection to default to.

II. Multiple Choice

1. b) Unreliable and fast — UDP trades reliability for minimal overhead and low latency.
