
Unit – 3 : Session – 2 : SLO – 2 | FCFS Waiting and Turnaround Time — True or False

FCFS Facts

1. FCFS scheduling allows pre-emption. — FALSE (it is non-preemptive)
2. Changing the order of process arrival can impact average waiting time. — TRUE
3. FCFS always gives the best turnaround time. — FALSE
4. FCFS uses a Last-In-First-Out (LIFO) queue. — FALSE (it uses a FIFO queue)
5. In FCFS, a short process may have to wait a long time if it is behind a long process. — TRUE
6. In FCFS, once a process starts executing, it continues until completion. — TRUE
7. Convoy effect refers to a situation where multiple long processes are executed in parallel. — FALSE (short processes wait behind one long process)
8. FCFS scheduling is classified as a non-preemptive algorithm. — TRUE
9. Reordering processes from [P1 (24), P2 (3), P3 (3)] to [P2, P3, P1] decreases the average waiting time. — TRUE (17 ms becomes 3 ms)
10. One of the goals of CPU scheduling is to minimize turnaround time and response time. — TRUE
