Activity (Solutions)

- 1) OOP vs functional in Java — OOP: objects carry mutable state and behavior; `class Counter { int n=0; void inc(){ n++; } }`. Functional: stateless pure transformations; `IntUnaryOperator inc = n -> n + 1; list.stream().map(inc).forEach(...)`. OOP emphasizes encapsulation and identity; functional emphasizes immutability and composition.
- 2) Same problem (sum of even numbers) — Procedural: `int s=0; for(int x: arr) if(x%2==0) s+=x;` OO/functional style: `int s = Arrays.stream(arr).filter(x -> x%2==0).sum();` — the first states how step-by-step; the second declares what to compute.
- 3) Declarative strengths: concise, readable, closer to problem domain, easier parallelization. Weaknesses: less control over performance, harder debugging of hidden control flow. Imperative strengths: full control, predictable performance, maps to hardware. Weaknesses: verbose, error-prone state management.
