

Unit – 1 : Session – 8 : SLO – 2 | Implement Threading**Activity (Solutions)**

- 1) Hello thread: `class Hello extends Thread { public void run(){ System.out.println("Hello"); } } new Hello().start();` — or `new Thread(() -> System.out.println("Hello")).start();`
- 2) Even/odd threads: `Thread even = new Thread(() -> { for(int i=2;i<=10;i+=2) System.out.println("Even "+i); }); Thread odd = new Thread(() -> { for(int i=1;i<=10;i+=2) System.out.println("Odd "+i); }); even.start(); odd.start();` — outputs interleave nondeterministically.
- 3) sleep and join: `Thread t = new Thread(() -> { try { Thread.sleep(500); } catch(InterruptedException e){} System.out.println("child done"); }); t.start(); t.join();` // main waits until t finishes
`System.out.println("main done");` — `sleep(ms)` pauses the current thread; `join()` makes the caller wait for the other thread's termination, so 'main done' always prints after 'child done'.
