

Unit – 4 : Session – 10 : SLO – 1 | TCP Sockets in Python

I. Multiple Choice

1. c) Wait for connections — `listen()` puts the server socket into passive mode, queuing incoming connection requests.

II. Fill in the Blanks

1. `bind()` associates the socket with an IP address and a port number.
2. `accept()` returns a new socket object for the client connection (plus the client's address).

III. Key Notes

1. Typical server sequence: `socket()` → `bind()` → `listen()` → `accept()` → `recv()/send()` → `close()`.
2. `listen(backlog)` only configures the queue; the actual handshake completes at `accept()`.
