
Unit – 2 : Session – 2 : SLO – 2 | Long-, Short- and Medium-Term Schedulers — Fill in the Blanks

Process Schedulers

1. A short-term scheduler decides which process gets the CPU next.
2. The long-term scheduler controls the degree of multiprogramming in the system.
3. The medium-term scheduler is responsible for swapping processes in and out of memory.
4. The short-term scheduler picks a process from the ready queue and allocates the CPU to it.
5. The medium-term scheduler handles processes that are in the suspended state.
6. The short-term scheduler executes frequently because CPU assignment must be quick.
7. The long-term scheduler controls the admission of new processes into the system.
