
Unit – 1 : Session – 5 : SLO – 2 | Modular OS and Virtualization — Unscramble

I. Unscrambled Words

1. uSn -> SUN — first half of the example of a modular-structure OS.
2. Sslario -> SOLARIS — second half; Sun Solaris is the classic modular-structure OS example.
3. iVrtual -> VIRTUAL — as in Virtual Machine.
4. Mnoolith -> MONOLITH — the monolithic kernel structure.
5. uGest -> GUEST — a virtual computer that runs inside a virtual environment on a host machine.
6. Htso -> HOST — the physical computer system on which the virtual machine software runs.
7. Kernle -> KERNEL — responsible for all major operations of the operating system.

II. Modular OS and Virtualization Layers

1. A modular OS uses loadable kernel modules (LKMs) — drivers and services are linked at runtime,
2. which lets a virtualization layer (hypervisor) be integrated cleanly, as in Linux KVM.
3. The hypervisor runs on the HOST and creates GUEST virtual machines, each with its own OS.
