
Unit – 3 : Session – 8 : SLO – 1 | Priority Scheduling Problems — Decode the Priority Puzzle

Assigned priorities (1 = highest)

P2 = 1, P4 = 2, P1 = 3, P3 = 4

Reasoning: with preemptive priority scheduling, P1 starts at $t = 0$ as the only process. P2 arrives at $t = 1$ with the highest priority and preempts P1 (runs 1-3). At $t = 3$ P4 arrives and, having higher priority than P1 and P3, runs 3-4. Then P1 runs 4-7 because its priority is higher than P3, and P3 runs last (7-10).

Gantt chart: | P1 | P2 | P4 | P1 | P3 | with boundaries 0, 1, 3, 4, 7, 10, giving the execution (completion) order P2, P4, P1, P3.
